

Bharat Badgujar

Linux module 2

Assignment 9

1.

Install Samba on your Linux system and create a shared folder named 'music-share' that is accessible from Windows machines on your local network.

Ans : Install Samba and Create Share

```
sudo apt update
```

```
sudo apt install samba -y
```

```
sudo mkdir -p /srv/music-share
```

```
sudo chmod 777 /srv/music-share
```

2.

Configure Samba to allow only users 'partyuser' and 'guestuser' to access the 'music-share' folder, and set a Samba password for each user.

Hint: Use the smbpasswd command to set Samba passwords after creating the Linux users.

Ans : Create Users and Set Samba Passwords

```
sudo adduser partyuser
```

```
sudo adduser guestuser
```

```
sudo smbpasswd -a partyuser
```

```
sudo smbpasswd -a guestuser
```

3.

Edit the smb.conf file to make the 'music-share' folder read-only for 'guestuser' but read/write for 'partyuser'.

Ans : Configure smb.conf

Edit:

```
sudo nano /etc/samba/smb.conf
```

Add:

[music-share]

path = /srv/music-share

browseable = yes

valid users = partyuser guestuser

read list = guestuser

write list = partyuser

Restart Samba:

sudo systemctl restart smbd

4.

From a Windows machine or VM, connect to the 'music-share' Samba share using the 'partyuser' account and copy a sample MP3 file into the share. Then verify from Linux that the file appears in the shared folder.

Ans : **Access from Windows**

Open File Explorer:

\\SERVER_IP\music-share

Login with:

- **Username:** partyuser
- **Password:** (Samba password)

Copy an MP3 file into the share.

Verify on Linux:

ls /srv/music-share

Example output:

song.mp3

5.

Restart the Samba service and use the smbstatus command to check if any clients are currently connected to your Samba share.
Hint: If no clients are connected, try accessing the share from another device first.

Ans : **Restart Samba and Check Connections**

Restart:

```
sudo systemctl restart smbd
```

Check connected clients:

```
sudo smbstatus
```
