

Bharat Badgujar

Linux module 2

Assignment 12

1.

Install the kickstart package on your Linux server and verify the installation by running the appropriate command.

Ans : **Install Kickstart**

```
sudo dnf install pykickstart -y
```

Verify:

```
ksvalidator --version
```

2.

Create a basic kickstart configuration file (ks.cfg) that automates the installation of CentOS or Rocky Linux with your preferred timezone, root password, and a user account named 'student'.

Ans : **Create ks.cfg**

```
nano ks.cfg
```

Example:

```
lang en_US.UTF-8
```

```
keyboard us
```

```
timezone Asia/Kolkata
```

```
rootpw redhat123
```

```
user --name=student --password=student123
```

```
reboot
```

3.

Set up an HTTP server (using Apache or nginx) to serve your kickstart file, and confirm you can access ks.cfg from another machine on the network via a browser or curl.

Ans : **Serve ks.cfg Using Apache**

```
sudo dnf install httpd -y
```

```
sudo systemctl enable --now httpd
```

```
sudo cp ks.cfg /var/www/html/
```

Test from another machine:

```
curl http://SERVER_IP/ks.cfg
```

or open in a browser:

```
http://SERVER_IP/ks.cfg
```

4.

Modify your kickstart file to automatically install the GNOME desktop environment and add a post-install script that creates a text file /home/student/welcome.txt with the message 'Welcome to your automated Linux setup!'.

Hint: Use the %post section in your ks.cfg for post-install commands.

Ans :

Install GNOME and Add Post-Install Script

Add to ks.cfg:

```
%packages
```

```
@^Server with GUI
```

```
%end
```

```
%post
```

```
echo "Welcome to your automated Linux setup!" > /home/student/welcome.txt
```

```
chown student:student /home/student/welcome.txt
```

```
%end
```

This installs the **GNOME Desktop Environment** and creates:

/home/student/welcome.txt

with the message:

Welcome to your automated Linux setup!
